ENERGY.LLC

WE POWER AI

CONFIDENTIAL · PRE-NDA OVERVIEW

August 2026 · energy.llc

AI needs **134 GW** of U.S. data-center power by 2030 — nearly triple 2025 levels — and the line for new grid connections runs **4 to 7 years**. **We solve that.**

Energy.LLC finds and controls the sites where power is already available, then delivers them — screened, proven, and de-risked — to power-hungry AI-compute end users. Sites are sold or built to suit.

MARKET SIZE

$6.7T
Data-center capex required worldwide by 2030 — $5.2T of it for AI
McKinsey, 2025

134 GW
U.S. data-center power demand by 2030 — ~3× 2025 levels
S&P Global / 451 Research, 2025

49 GW
Projected U.S. power shortfall for data centers by 2028
Morgan Stanley, 2026

$600K–$1M
Per-MW value of fully powered land vs. $250–350K for sites with interconnection risk remaining
Company analysis; consistent with published powered-land premiums, 2025–26

THE PROBLEM — POWER, NOT CHIPS

- **The queue is the bottleneck.** Median ~5 years from grid request to operation nationally; 7+ years in PJM. (LBNL, PJM 2025)
- **Most sites die waiting.** ~87% of capacity that enters U.S. interconnection queues is never built. (LBNL Queued Up)
- **Nothing is left to lease.** Record-low 1.4% data-center vacancy; 0.3% in Northern Virginia. (CBRE, 2026)

> *"You may actually have a bunch of chips sitting in inventory that I can't plug in… It's not a supply issue of chips; it's actually the fact that I don't have warm shells to plug into."*
> — Satya Nadella, Microsoft CEO, Nov 2025

Time to power

Bars drawn to midpoint of typical ranges. Sources: LBNL, PJM (2025); company timeline.

WHY WE WIN

Search → Evaluate → Develop → Build

- **AI-native origination at scale.** Our proprietary engine maps existing grid capacity, gas, fiber, and community sentiment across entire regions — a wide-funnel, principal-risk model that brokers and land bankers don't run. Screening eliminates 3 of 4 sites before capital is committed.
- **Rights, not software.** We take control of sites — not SaaS fees, not commissions — capturing principal upside on every de-risked MW.
- **Capital-light and fast.** Option → de-risk → deliver in ~24 months. No construction risk, no land-banking balance sheet. Focus: 5–50 MW edge-scale sites in TX, VA & OH.
- **Operating playbook.** The team already runs this development model in live battery-storage projects. Every site ships data-room-ready — facts sourced and dated.

CUSTOMER TRACTION

Signed
Development contracts & retainers — contracted work funds operations

~1,400
Prospective sites identified & screened across 8+ states

50+
Sites at "Site Ready"; 15+ more in active due diligence

800+ MW
Natural-gas capacity identified, line of sight

MSAs, SOWs, and LOIs in negotiation with development partners across Texas and the Midwest · utility research partnership in advanced negotiation, structured to provide access to 8–10 utilities · demand pull is market-wide: 74% of North American data-center capacity under construction is already pre-leased (CBRE).

THE OPPORTUNITY

Energy.LLC is raising **development capital and project equity** for its 2026–27 site portfolio. Development capital funds site control and de-risking (≈$1–2M per 20 MW site); project equity funds delivery to AI-compute end users. **Full deck, financial model, and data room available under NDA.**
